

Executive Summary — FNP Sales Analysis

1. Business Objective

The objective of this project is to analyze FNP's sales and order data to understand **revenue performance, customer purchasing behavior, product/category contribution, geographical performance, seasonal trends, and delivery efficiency.**

The analysis was designed to answer key business questions such as:

- How much revenue and how many orders are being generated?
- Which product categories contribute the most revenue?
- Which locations/cities generate the highest sales or order volume?
- Which months and occasions drive higher revenue?
- What are the peak ordering hours?
- How efficiently are orders being delivered?
- Which products generate the highest revenue?
- Where are there opportunities to improve sales and customer experience?

2. Key Performance Indicators

KPI	Result	Business Meaning
Total Orders	1,000	Overall order volume analyzed
Total Revenue	₹35,20,984	Total sales revenue generated
Average Customer Spend	₹3,520.98	Average revenue generated per order/customer
Average Order-to-Delivery Time	5.53 days	Indicates the average delivery duration

The dashboard provides an overall view of **₹35.21 lakh in revenue from 1,000 orders**, with an average spend of approximately **₹3,521 per order**.

3. Revenue Performance by Category

The category analysis shows that revenue is not evenly distributed across products.

Major revenue-generating categories

- **Colors** is the highest-revenue category, generating approximately **₹10 lakh**.
- **Soft Toys** contributes around **₹7.3 lakh**.
- **Sweets** contributes around **₹7.2 lakh**.
- **Cakes** contributes approximately **₹3.2 lakh**.
- **Raksha Bandhan** generates approximately **₹2.9 lakh**.
- **Plants** and **Mugs** contribute around **₹2 lakh each**.

Business Insight

The dashboard indicates that a relatively small number of categories account for a substantial portion of overall revenue. In particular, **Colors, Soft Toys, and Sweets** are important revenue drivers.

This suggests that these categories could receive greater attention in terms of:

- Inventory planning
- Promotional campaigns
- Product bundling
- Seasonal offers
- Cross-selling opportunities

At the same time, lower-performing categories could be evaluated to understand whether the issue is related to **pricing, demand, product variety, promotion, or seasonality**.

4. Monthly Revenue Analysis

Monthly revenue shows considerable variation throughout the year.

The dashboard indicates particularly strong revenue during:

- **February**
- **March**
- **August**
- **November**

Among these periods, **August and February** show some of the highest revenue peaks.

In contrast, several other months show considerably lower revenue.

Business Insight

The variation suggests that FNP's business is strongly influenced by **seasonality and occasions**.

Instead of treating every month equally, the company could use historical seasonal patterns to:

- Increase inventory before high-demand periods
- Launch campaigns ahead of major occasions
- Prepare additional delivery capacity
- Increase marketing budgets during high-potential periods
- Create targeted offers during weaker months

This can help the business move from reactive sales management toward **seasonal demand planning**.

5. Revenue by Occasion

The dashboard provides occasion-based filtering for:

- Anniversary
- Birthday
- Diwali
- Holi
- Raksha Bandhan
- Valentine's Day

This is particularly relevant for FNP because customer purchasing behavior is closely connected with **gifting occasions and festivals**.

Business Insight

Occasion-based analysis allows management to identify which celebrations generate stronger demand and then customize:

- Product recommendations
- Promotional campaigns

- Gift bundles
- Discounts
- Email/SMS marketing
- Inventory levels

For example, if a particular occasion consistently generates high sales, the business can prepare its inventory and marketing campaigns several weeks in advance.

6. Top Products by Revenue

The **Top 5 Products by Revenue** analysis identifies:

1. **Magma Set**
2. **Quia Gift**
3. **Delores Gift**
4. **Harum Pack**
5. **Deserunt Box**

Among these, **Magma Set generates the highest revenue**, followed by **Quia Gift**.

Business Insight

These products can be considered important contributors to the company's revenue performance.

The business could analyze these products further based on:

- Number of orders
- Average selling price
- Profit margin
- Customer segment
- Occasion
- Location
- Repeat purchases

High-revenue products could also be used as anchor products in **bundles and cross-selling strategies**.

7. Geographical Revenue Analysis

The dashboard shows noticeable differences in revenue across locations.

Some of the highest-revenue locations generate approximately:

- ₹6.75 lakh
- ₹6.32 lakh
- ₹5.87 lakh
- ₹5.75 lakh

while other locations generate considerably less revenue.

Business Insight

This indicates that geographical demand is uneven.

The business can use this information to:

- Identify high-performing markets
- Allocate inventory according to regional demand
- Target low-performing areas with localized promotions
- Study customer preferences by location
- Optimize delivery operations

However, revenue alone should not be used to judge geographical performance.

Orders, average order value, customer count, and profit should also be considered.

8. Top Cities by Number of Orders

The dashboard's Top 10 Cities analysis shows that:

- **Imphal** has approximately **29 orders**
- **Dhanbad** has approximately **28 orders**
- **Kolkata** has approximately **27 orders**
- **Haridwar** has approximately **24 orders**
- Several other cities fall within the approximately **18–21 order range**

Business Insight

The city-level analysis helps identify where order volume is concentrated.

An important next step would be to compare **order volume against revenue**.

For example:

A city with many orders but relatively low revenue may have a lower average order value, while a city with fewer orders but high revenue may have higher-value customers.

This comparison could provide more actionable information than order count alone.

9. Revenue by Order Time

The hourly revenue analysis shows fluctuations throughout the day.

Revenue appears relatively strong during the **evening period**, with a noticeable peak around **19:00–20:00**.

Business Insight

This suggests that customer purchasing activity may be stronger during evening hours.

The company could potentially use this information for:

- Time-specific promotional campaigns
- Push notifications
- Flash offers
- Personalized recommendations
- Staffing and customer-support planning

However, hourly revenue should ideally be compared with **number of orders and average order value** before making operational decisions.

10. Delivery Performance

The average **Order-to-Delivery Time is 5.53 days**.

Delivery time is an important customer-experience metric for a gifting business because customers often purchase products for a **specific occasion or date**.

Business Insight

A useful next-level analysis would be to examine delivery time by:

- City
- Product category

- Occasion
- Month
- Order volume
- Delivery region

This would help identify whether certain locations, categories, or periods experience longer delivery times.

11. Overall Business Insights

From the dashboard, several major patterns emerge:

1. Revenue is concentrated

A few product categories contribute a significant share of total revenue, particularly **Colors, Soft Toys, and Sweets**.

2. Sales are seasonal

Revenue fluctuates significantly by month, with major peaks around certain periods. This highlights the importance of **occasion-based and seasonal planning**.

3. Geography matters

Revenue and order volume vary considerably across locations and cities, indicating differences in customer demand.

4. Certain products are major revenue contributors

The Top 5 product analysis provides a clear opportunity to focus on high-performing products and understand what makes them successful.

5. Evening purchasing activity is relatively strong

The hourly analysis indicates notable revenue activity during the evening, particularly around **7–8 PM**.

6. Delivery efficiency is an important area for further analysis

The average delivery time of **5.53 days** provides a useful baseline, but city-, category-, and occasion-level analysis would give more actionable insights.

12. Business Recommendations

Based on the analysis, the following actions could be considered:

A. Strengthen high-performing categories

Maintain adequate inventory and promotional support for major revenue-generating categories such as Colors, Soft Toys, and Sweets.

B. Prepare for seasonal demand

Use historical monthly and occasion-level patterns to forecast demand and prepare inventory before high-sales periods.

C. Develop city-specific strategies

Identify high-revenue cities and high-order-volume cities separately. Use localized campaigns for markets with growth potential.

D. Promote high-performing products

Use the Top 5 products as part of bundles, recommendations, and occasion-specific campaigns.

E. Optimize evening marketing

Since evening hours show relatively strong revenue activity, promotional campaigns could be tested during these periods.

F. Investigate delivery performance

Analyze the factors behind the 5.53-day average delivery time and identify locations or periods where delivery takes longer.

G. Combine revenue with profitability

Revenue is only one part of business performance. Future analysis should incorporate **profit margin, discounts, shipping costs, and returns** to determine which products and locations are genuinely most valuable to the business.
